This graph shows a typical gain with a Dynojet jet kit.
STAGE ONE INSTRUCTIONS

1. Remove carb tops and remove spring from slide. Thread one of the slide cover screws into the center of the needle retainer (Fig. A) and pull up gently. Remove stock needles and spacers, noting order of assembly (Fig. C).

2. Locate the slide lift holes in the bottom of the slide. Using the drill bit provided (DD #44) enlarge both your slide lift holes (Fig. B). Some models already have enlarged slide lift holes from the factory, if so no drilling is necessary.

3. Install Dynojet needles on groove #3 from the top. Use all stock spacers (Fig. C). Install the small Dynojet washers above the E-clip. Install the stock needle retainers with the Dynojet springs (DSP007). After installing the slides in carbs be sure to check slide movement manually.

4. Remove the stock main jets and replace with the Dynojet main jets provided. If you are running the stock exhaust install the DJ116 main jets. If you are running an aftermarket exhaust or slip-on with a high flowing baffle, use the DJ120 main jets. NOTE: If you are using a K&N air filter then use the DJ120 main jets with the stock exhaust and the DJ124 main jets with high flowing aftermarket exhaust.

5. Locate the fuel mixture tab (Fig. D). Using the tool supplied (DT009), carefully turn the tabs clockwise until they lightly seat and then back out 2 turns.
