This graph shows a typical gain with a Dynojet jet kit.
1. Remove the vacuum slide from the carbs. Remove the stock needles & spacers, noting the order of assembly. Locate the slide lift holes using (Fig. A), with the slide drill (DD #29) supplied, enlarge your slide lift holes. The picture may not show your slide exactly, enlarge your slide lift hole or holes depending on your model. **Do not drill any new lift holes. Do not drill the needle hole.**

2. Install the Dynojet needles on groove #3, using all stock spacers. Install the Dynojet washers above the E-clip.

3. Remove the stock main jets and replace with the Dynojet main jets provided. If you are running the stock exhaust use the DJ124 main jets, if you are running an aftermarket header or slip-on with a high flowing baffle, use the DJ128 main jets. Be sure that the jets you are changing are the main jets.

4. Locate the fuel mixture tabs (Fig. B). On most models the tab travel is limited by stops on the float bowls. To get full tab travel, switch the left side bowls with the right side bowls. Turn tabs clockwise until they seat, then back out 2-1/2 turns.
