This graph shows a typical gain with a Dynojet jet kit.
1. Remove the vacuum slide from the carbs. Remove the stock needles & spacers, noting the order of assembly. Using the slide drill (DD# 5/32) provided, drill your slide lift holes (Fig. A), the picture may not show your slide exactly. Drill your existing slide lift holes only, do not drill any new holes and do not drill the needle hole.

2. Install the needle shrouds (DNJT02) with the cutaway facing up and towards the engine (Fig. B). Slip the shroud slightly over the stock needle jet and hold, now touch a dab of glue on the outer base of the stock needle jet. Press needle shroud down and allow to dry thoroughly. Check for any visible excess glue.

3. Install the Dynojet needles on groove #3, using all stock spacers (Fig. A). Install the Dynojet washer above the E-clip.

4. Remove the main jets and replace with the Dynojet main jets provided. Use the DJ136 main jets with stock exhaust pipe, or use the DJ140 main jets with aftermarket header or slip-on with a high flowing baffles. If you modify or remove the airbox lid you may run the DJ144 main jets (Stage 2). Be sure that the jets you are changing are the main jets.

5. Locate the fuel mixture screw plug (Fig. C). If you see a screw, proceed to the adjusting procedure. Using the DD #5/32 drill bit provided, carefully drill thru the plugs. NOTE: the mixture screws are directly underneath the plug, be ready to pull back on the drill the instant you break thru. Use screw provided to secure and remove the plug. Carefully turn mixture screw clockwise until seated, then back out 2-1/2 turns.
